

ABSTRACT

A 90° angle clamping plier is provided, having a handle portion which includes an adjustable, lockable, clamping mechanism, operably connected to two arms. Each arm includes an end portion and a medial portion. Pivotaly secured to the end portions of each arm is a clamping jaw. The two clamping jaws form a constant angular relationship with respect to each other. The invention is so designed that when the handle portion is gripped, the clamping jaws move toward each other so as to meet and engage planar work pieces there between at a 90° angled relationship. Once the work pieces are clamped between the clamping jaws, they may be locked in such position by the locking mechanism in the handle portion of the device.
